Uncommon Intake: Project Scope

What you will find in the project, and the tools used to build it. Bright Moyo, Final Capstone Project, AI Integration.

Where to find it

What	Link
Live website	https://uncommon-intake.netlify.app
Android app	Download for Android on the website
Frontend repository (app and website)	https://github.com/goldenboymoyo-gif/uncommon-intake
Backend repository (database, server, AI)	https://github.com/goldenboymoyo-gif/uncommon-intake-backend

Each repository has a README with setup, the AI explanation and its limitations, screenshots, and the ethical and responsible AI statement.

The problem it solves

Uncommon.org runs a free, 12 month technology bootcamp for unemployed young adults across 13 Innovation Hubs in Zimbabwe. Interviews happened by phone call, WhatsApp and email, so people who missed a call or had no data could lose their chance, and staff had no shared record or overview. Uncommon Intake puts applying, interviewing, review, decisions and student support in one place that works on a cheap phone with little data.

What you will find in the app and website

Applicants

• Create an account and sign in with a code sent by email. No passwords.

• Apply in two steps with autosave: details and hub, then a CV (or a short "about you") and a motivation letter.

• AI checks each file is the right kind of document and asks kindly for the right one if not. Unreadable files are still accepted.

• Answer 10 personal interview questions, written by AI from the CV and letter, by typing, voice or short video, at any time.

• Low data mode: answers are saved on the phone and uploaded when there is signal.

• A status page, and the decision in the app, by notification and by email. Accepted applicants confirm their place.

Students and graduates

• Career coach chat for CVs, cover letters and job interview practice.

• English Tutor with a placement check, lessons, voice answers and Listen (read aloud).

• Job opportunities, surveys from instructors, attendance check in, weekly LinkedIn reminders and a progress page.

• Profile with photo and bio. Anyone can delete their own account and data.

Staff, hub leads and admins

• Staff sign up with an @uncommon.org email and choose a hub. A hub lead or admin approves them.

• Each staff member sees only their own hub. Admins see every hub.

• Review board with search and filters. Each applicant shows answers, recordings, transcripts, AI summaries, CV, letter and notes.

• Accept, waitlist or decline. People on the waiting list can be decided later. Every decision is logged.

• Overview from real data, surveys with AI themes, messages, jobs, job outcomes and graduate stories (with consent).

How AI is used

Feature	What the AI does	Model
Uploaded files	Checks a CV is a CV and a letter is a letter	gpt-6-luna
Interview questions	Writes 10 questions from the CV and letter	gpt-6-luna
Interview answers	Speech to text, then a short summary for staff	gpt-transcribe, gpt-6-luna
Surveys	Finds themes, each linked to the real answers	gpt-6-luna
Career coach and English Tutor	Coaching, teaching and marking single answers	gpt-6-luna
Listen	Reads a message aloud	gpt-4o-mini-tts

People decide, AI helps: no AI result accepts, rejects, ranks or scores anyone. All AI runs on the server, so no key is in the app. Interview questions never touch age, gender, family, religion, tribe, health, money or politics, and there is no face or voice tone analysis.

Tools used

Area	Tool	Used for
App and website	React Native, Expo (SDK 57), TypeScript, Expo Router	One codebase for the Android app and the website
Backend	Supabase Edge Functions (Deno, TypeScript)	Server logic and every AI call
Database	Supabase PostgreSQL with Row Level Security	All data, with access rules on every table
Login	Supabase Auth with email codes, Gmail SMTP	Sign up and sign in without passwords
Files	Supabase Storage (private buckets)	CVs, letters, recordings and photos with expiring links
Scheduled jobs	pg_cron	LinkedIn reminders, weekly updates, deleting recordings after about 90 days
AI	OpenAI API (Responses API, speech to text, text to speech); Hugging Face as backup	Questions, transcripts, summaries, themes, coaching, document check
Recording	expo-audio, expo-camera, browser recording	Voice and video answers on phones and laptops
Notifications	Expo push notifications, web push	Decisions, surveys, messages and reminders
Hosting and release	Netlify, Expo EAS Build, EAS Update	The live website, the Android APK and updates
Code	Git and GitHub	Two repositories with full commit history

Changes from the proposal

• Built with React Native and Expo instead of Next.js, so it is a real Android app as well as a website. Server code runs in Supabase Edge Functions, and hosting is Netlify and Expo EAS instead of Vercel.

• Instead of five fixed questions, AI writes 10 personal questions from each applicant's CV and motivation letter.

• Instead of letter feedback, applicants upload a CV and motivation letter and AI checks they are the right documents.

• Added: English Tutor, job opportunities, attendance and LinkedIn reminders, staff sign up with hub approvals, and account deletion by staff.

Out of scope

• AI making or suggesting decisions about people.

• Face, voice tone or emotion analysis.

• An iPhone App Store release (iPhone users add the website to their home screen).

• Payments (the bootcamp is free).
